Generative AI Can Harm Teaching

Alp Sungu, Benjamin Lira, Angela L. Duckworth

University of Pennsylvania

INFORMS Annual Meeting 2026

Overview

1. In 14 Turkish schools, we **randomly assigned** 193 teachers to get a GPT-4o teaching assistant or teach as usual for one semester.
2. 78% used it, mostly to produce teaching material, with little back-and-forth.
3. Students' intrinsic motivation fell (–0.11 SD), most under teachers who already used AI heavily.
4. Confidence fell less, mainly under weaker teachers.
5. Standardized test scores did not move on average, but students of weaker teachers lost 0.13 SD.
6. Teachers' beliefs about AI did not change: a principal–agent problem.

Teachers already use generative AI

60%

of U.S. K-12 teachers used an AI tool last school year

Gallup & Walton Family Foundation 2025

1/3

use it every week

Gallup & Walton Family Foundation 2025

No causal evidence on its effects on students.

AI could increase or decrease the quality of teaching

Optimistic

High-quality content.

Time freed for rehearsal, relationships and differentiation.

Oreopoulos et al. 2024

Pessimistic

Teachers offload the pedagogical thinking.

Materials come out polished but generic.

Time saved might not be reinvested.

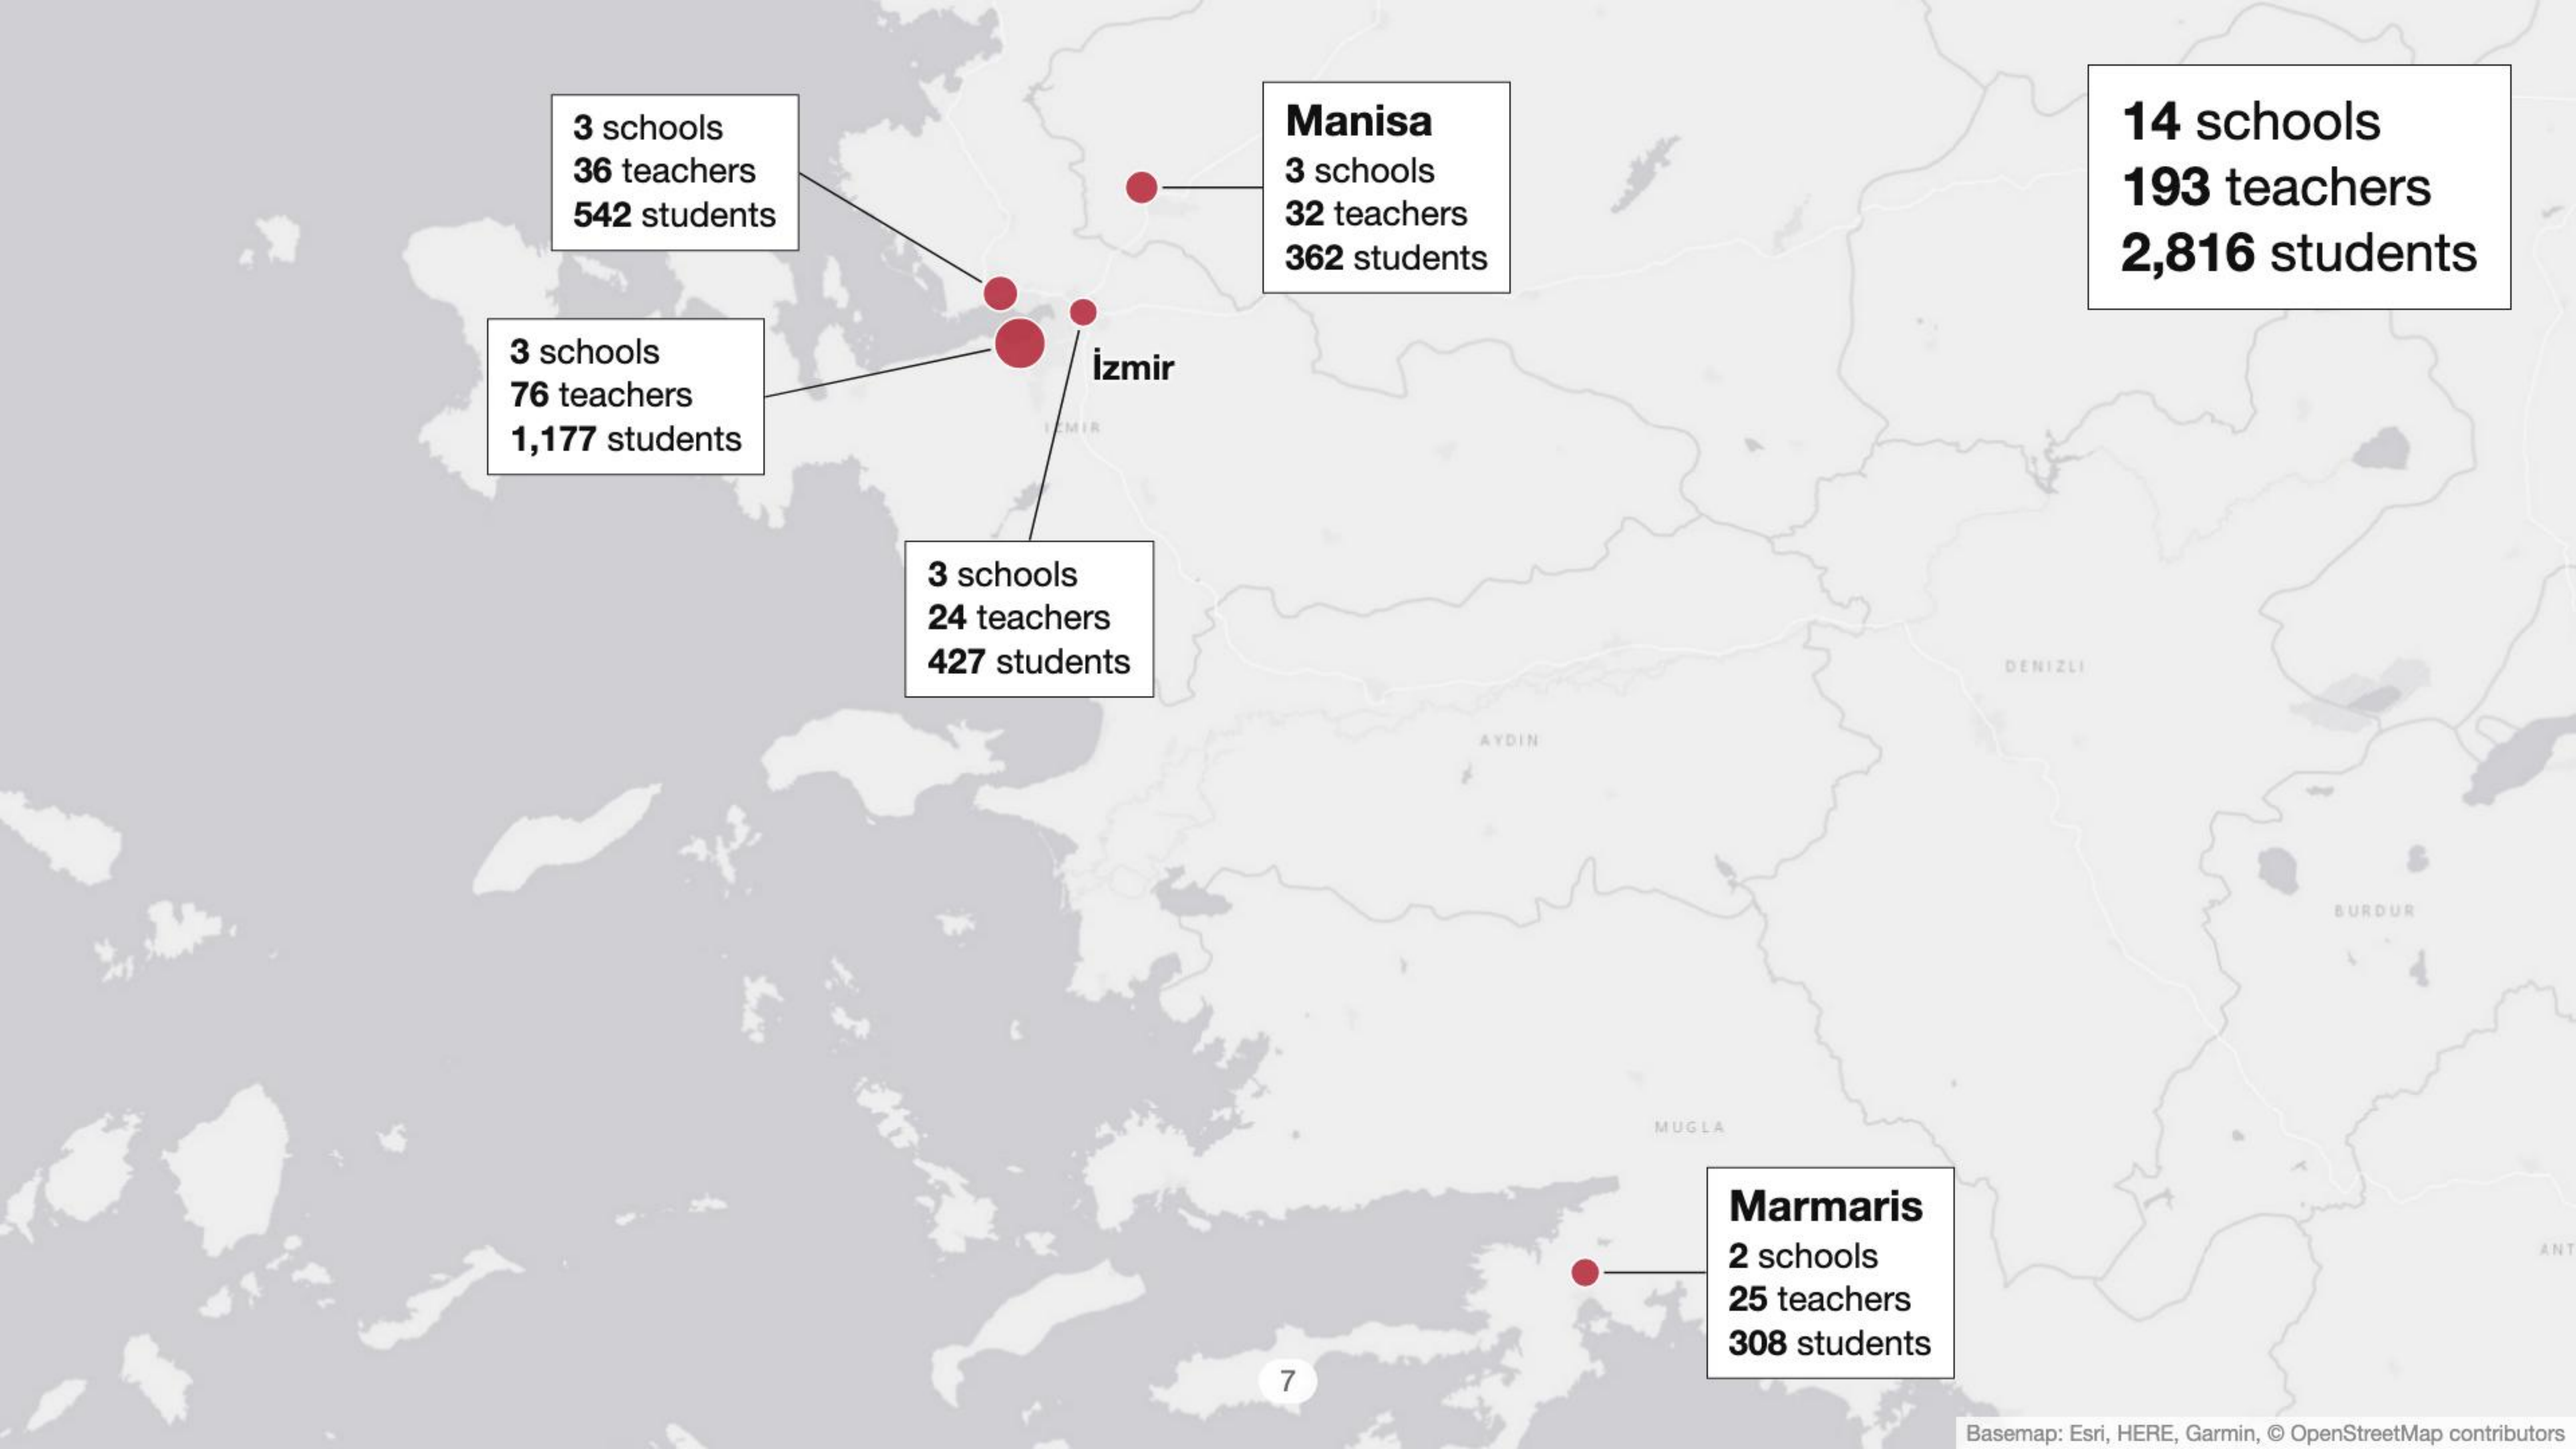

Doshi & Hauser 2024
Farber et al. 2014

Five questions about what happens when teachers use AI

1. Adoption: do teachers use the tool?
2. Usage: what do they use it for?
3. Intrinsic motivation and confidence: how do students feel about their classes?
4. Standardized test scores: do students learn more or less?
5. Teacher beliefs: what do teachers come to believe about AI?

Your AI Usage Report This Week

AI Teaching Assistant team Sun, Feb 9, 2025

Hello Teacher,

Here is some data on your use of the AI tool:

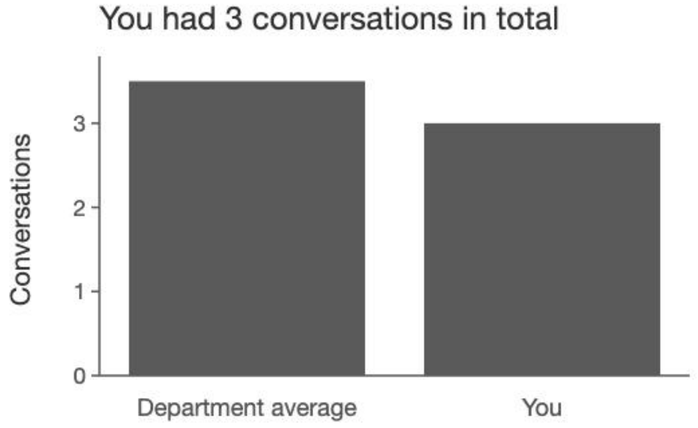

- You sent **8** messages.
- You had **3** conversations.
- You used the AI for about **1** minute in total.

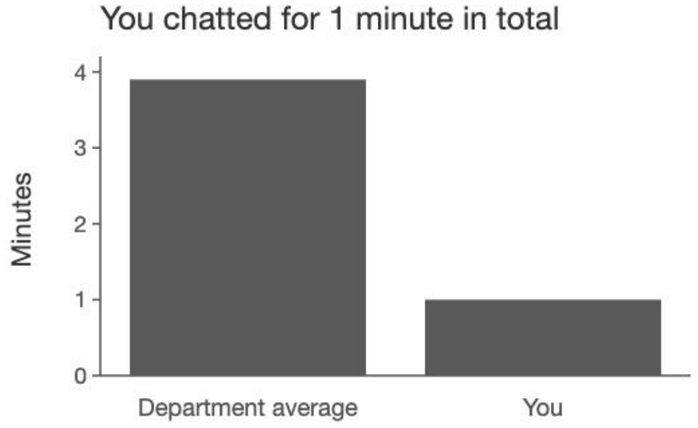

You've made a great start toward exploring more! Wishing you a successful new week.

Feel free to reach out with any questions.

Best wishes

Timeline

August–December 2024

Pre-period

Baseline standardized test scores collected

January 2025

Training

Teachers receive AI training and complete questionnaires

February–May 2025

Intervention Period

Treated teachers use AI tool
Control teachers teach as usual

Standardized test scores collected

May 2025

Endline

Teachers and students complete questionnaires

Fall Semester 2024

Winter Break

Spring Semester 2025

Five questions about what happens when teachers use AI

1. Adoption: do teachers use the tool?
2. Usage: what do they use it for?
3. Intrinsic motivation and confidence: how do students feel about their classes?
4. Standardized test scores: do students learn more or less?
5. Teacher beliefs: what do teachers come to believe about AI?

Most teachers did adopt the AI tool

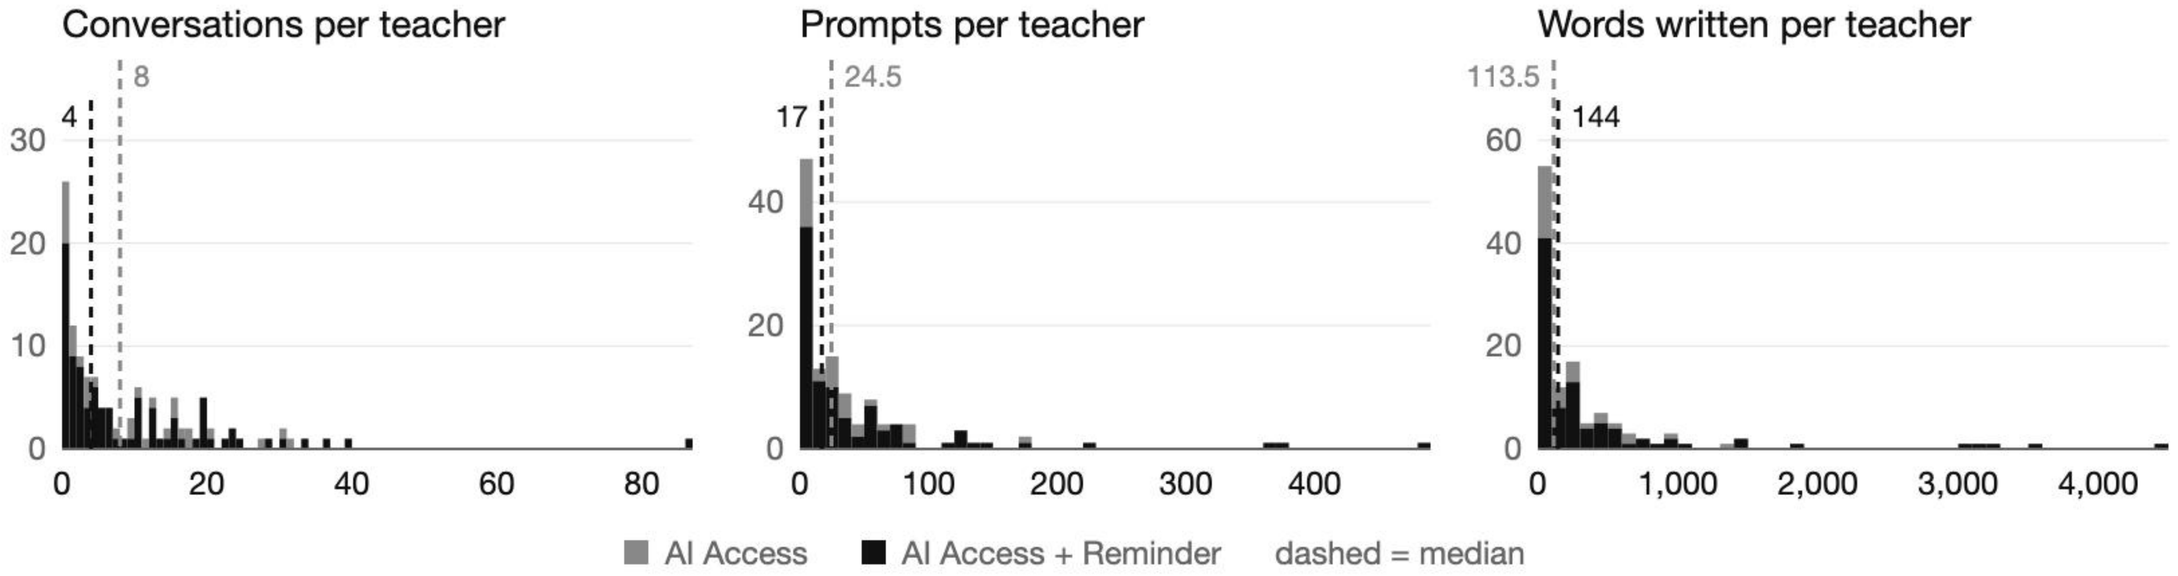

80%

AI Access (24 of 30)

78%

AI Access + Reminder (70 of 90)

Difference: p > .99

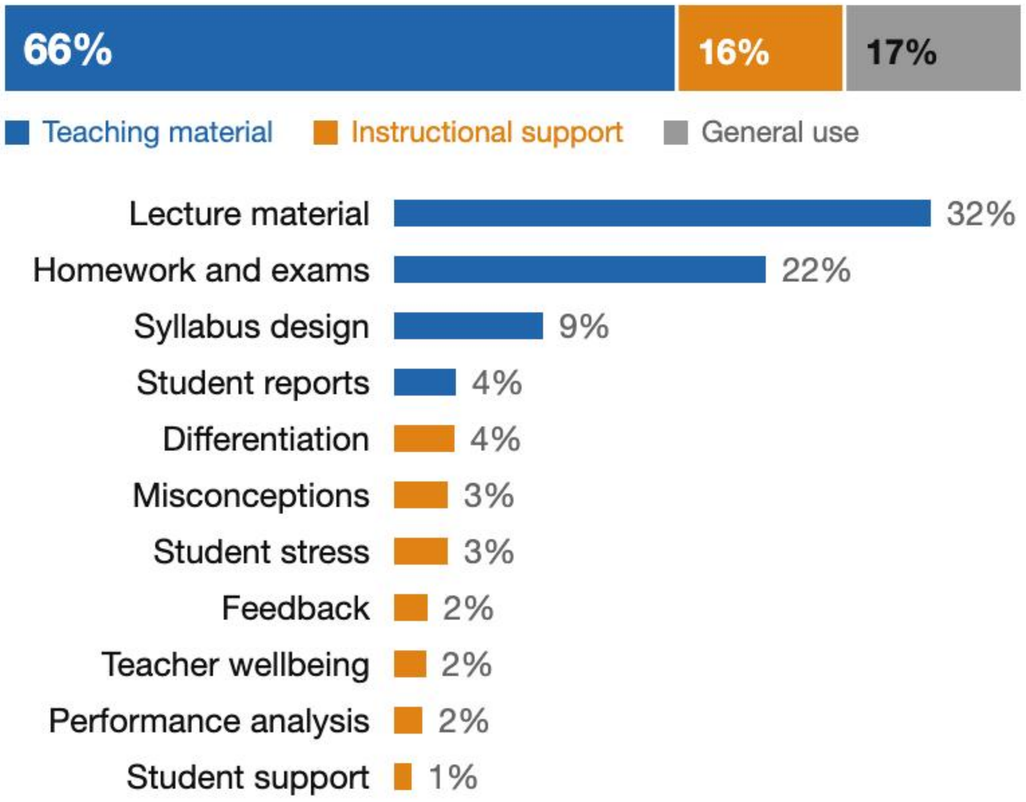

Five questions about what happens when teachers use AI

2. Usage: what do they use it for?
3. Intrinsic motivation and confidence: how do students feel about their classes?
4. Standardized test scores: do students learn more or less?
5. Teacher beliefs: what do teachers come to believe about AI?

Teachers used the AI tool in different ways

1,070 conversations from 94 teachers

Teacher prompts per conversation

Teachers delegated: they asked for finished materials and rarely iterated

66%

of conversations asked for teaching material: lectures, homework, exams, syllabi

16%

asked for instructional support: differentiation, misconceptions, feedback

2

teacher prompts in the median conversation

A chemistry teacher accepted the first lesson plan the tool offered

Teaching material

Lesson planning: a chemistry teacher, high school. From the tool logs, translated

Make an inference about how scientific knowledge changes through atomic theories.
Course: [Chemistry] Grade: [9th Grade]

Here is a concise plan:
1. Objective: explain how atomic theories changed.
2. Activity: timeline discussion.
3. Assessment: short-answer quiz.
[…]

Thank you, that's suitable.

You're welcome.

A department head asked the tool how to check on teachers' wellbeing

Instructional support

Wellbeing planning: a mathematics department head, high school. From the tool logs, translated

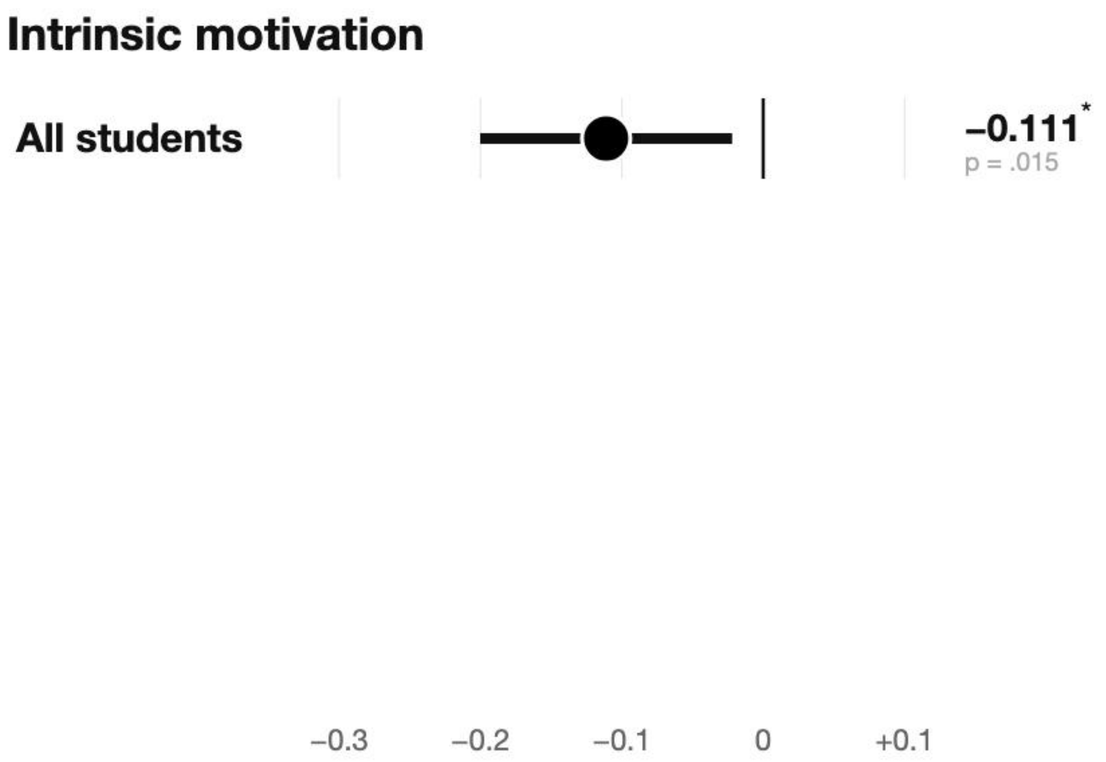

As a department head, how can I identify our teachers' state of wellbeing?

Of course. In high-school mathematics, stress may come from economic difficulties, achievement pressure, and limited resources.
Use anonymous pulse surveys, brief check-ins, and workload review. Then discuss supports such as shared planning time, peer mentoring, clearer priorities, and realistic self-care strategies. […]

Five questions about what happens when teachers use AI

1. Adoption: do teachers use the tool?
2. Usage: what do they use it for?
3. Intrinsic motivation and confidence: how do students feel about their classes?
4. Standardized test scores: do students learn more or less?
5. Teacher beliefs: what do teachers come to believe about AI?

AI lowered students' intrinsic motivation

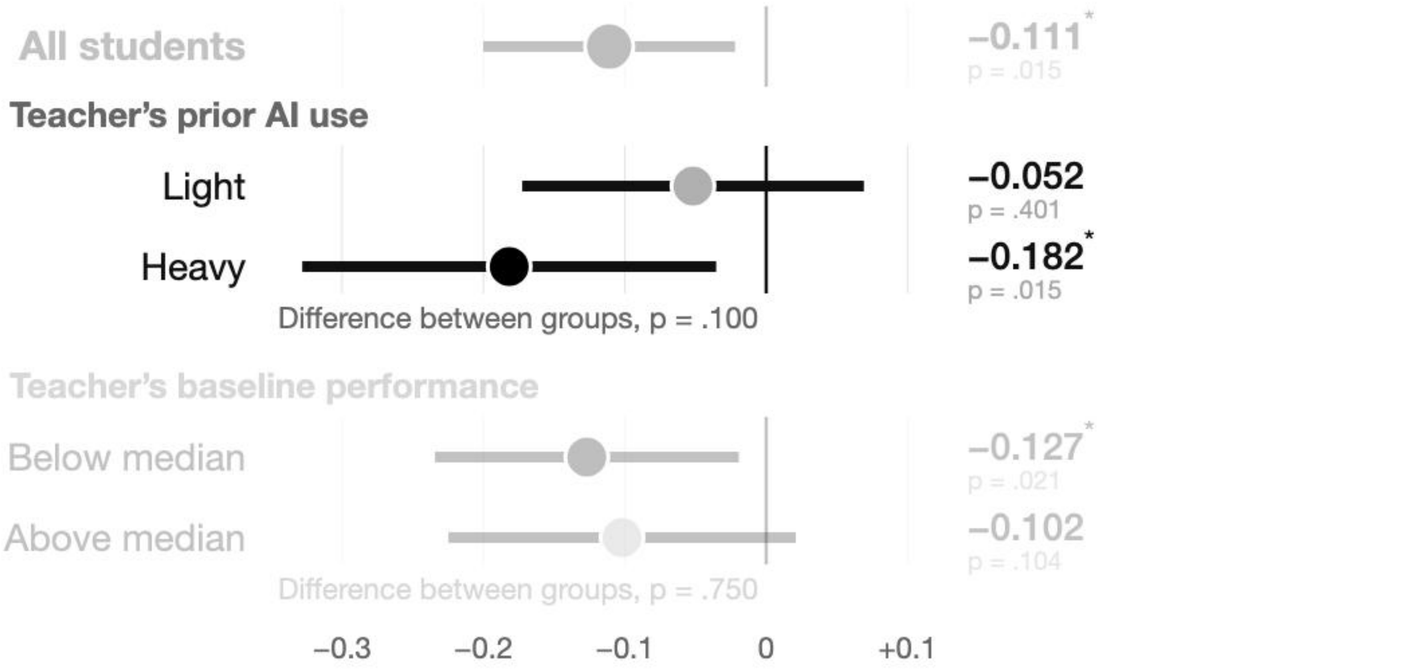

Details

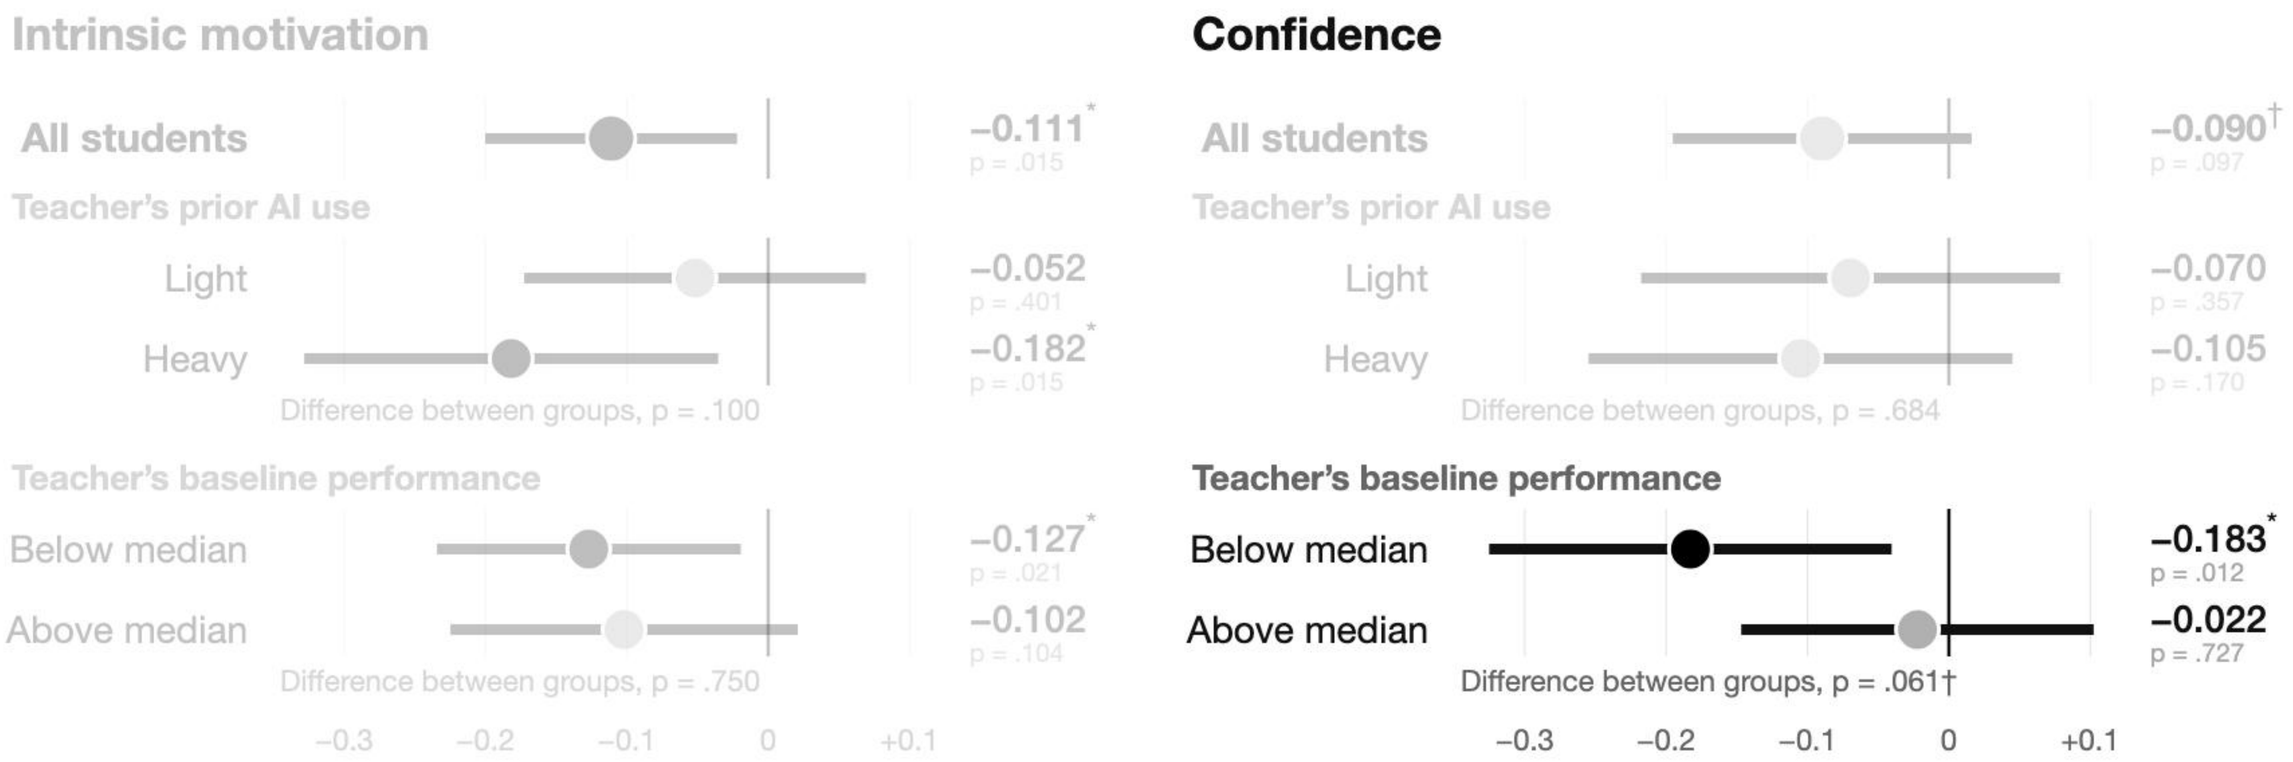

Fredricks et al. 2004

…especially for teachers higher in baseline AI use

Intrinsic motivation

Confidence fell less

"What overall impact do you believe AI tools have on students' learning outcomes?"

Details

Limitations

Duration

We observe one semester.

Tool specificity

We test one AI tool design.

Contamination

Control teachers could use free AI tools, so our estimates are conservative.

We cannot assume AI helps in schools without more careful design

Optimists

We are too cautious and leave gains on the table.

Gans 2025

Pessimists

Rapid adoption outruns our understanding of the harms.

Bick et al. 2026

Schools should scale AI for teachers with care.

Summary

1. In 14 Turkish schools, we **randomly assigned** 193 teachers to get a GPT-4o teaching assistant or teach as usual for one semester.
2. 78% used it, mostly to produce teaching material, with little back-and-forth.
3. Students' intrinsic motivation fell (–0.11 SD), most under teachers who already used AI heavily.
4. Confidence fell less, mainly under weaker teachers.
5. Standardized test scores did not move on average, but students of weaker teachers lost 0.13 SD.
6. Teachers' beliefs about AI did not change: a principal–agent problem.

Thank you

Benjamin Lira, blira@upenn.edu

Paper

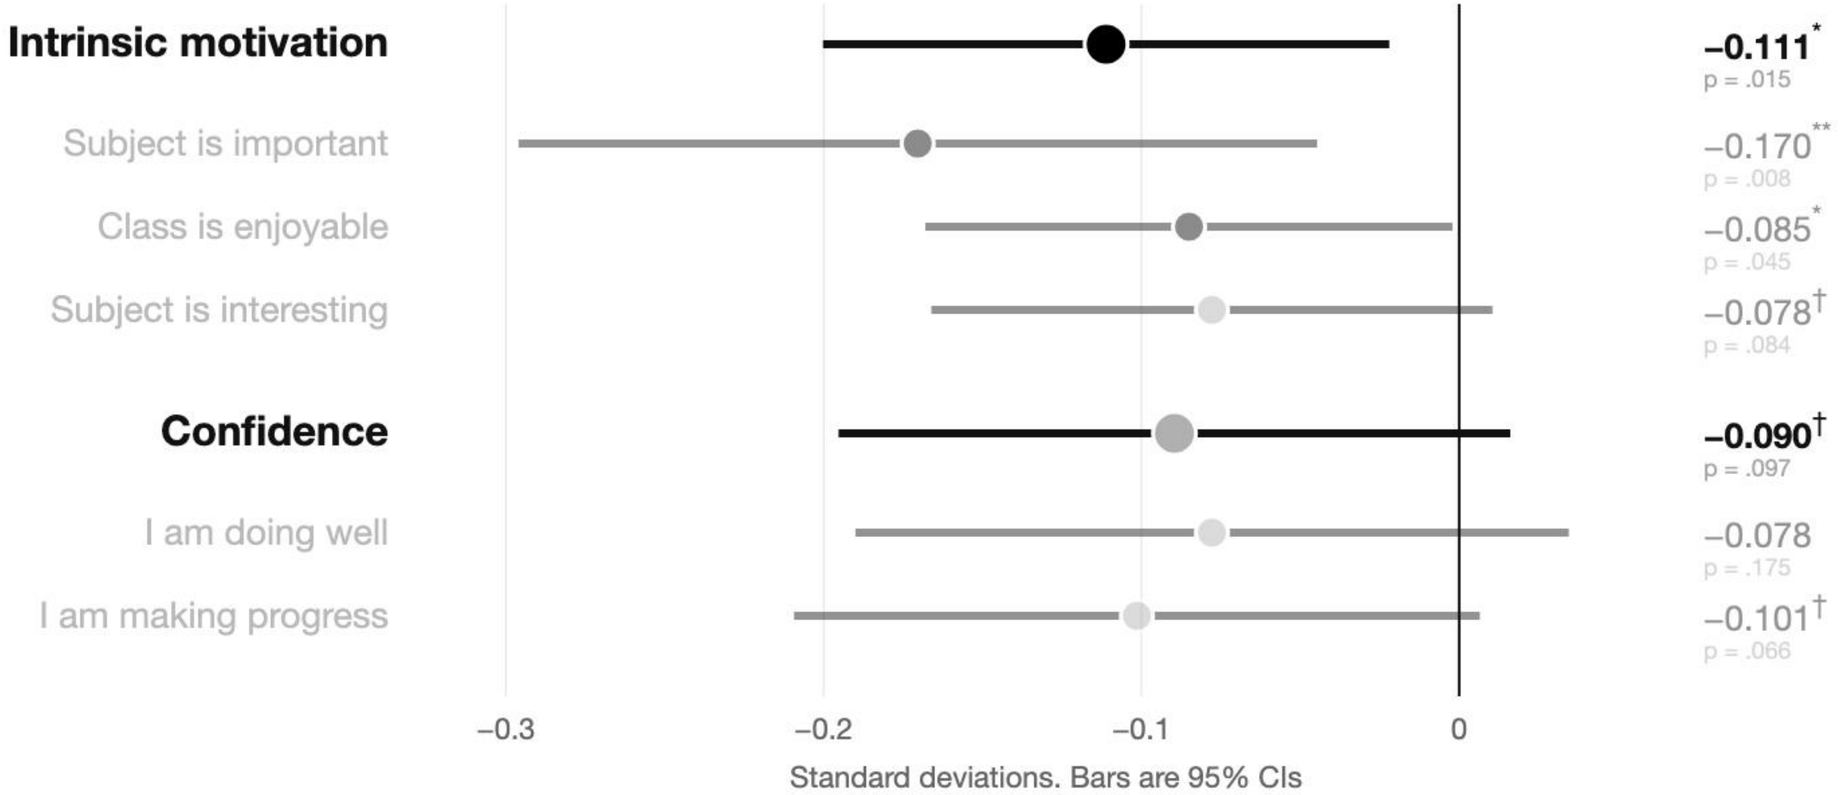

Code and data

Robustness checks

Attrition	Response rates did not differ by condition. Lee bounds stay negative.
Within-school variation	Every school had AI and control teachers.
Fixed effects	Still negative, though smaller, with department, school and student fixed effects.
Single items	No one survey item drives the result.
Arms and dosage	Same pattern for each AI arm and for AI-teacher share.

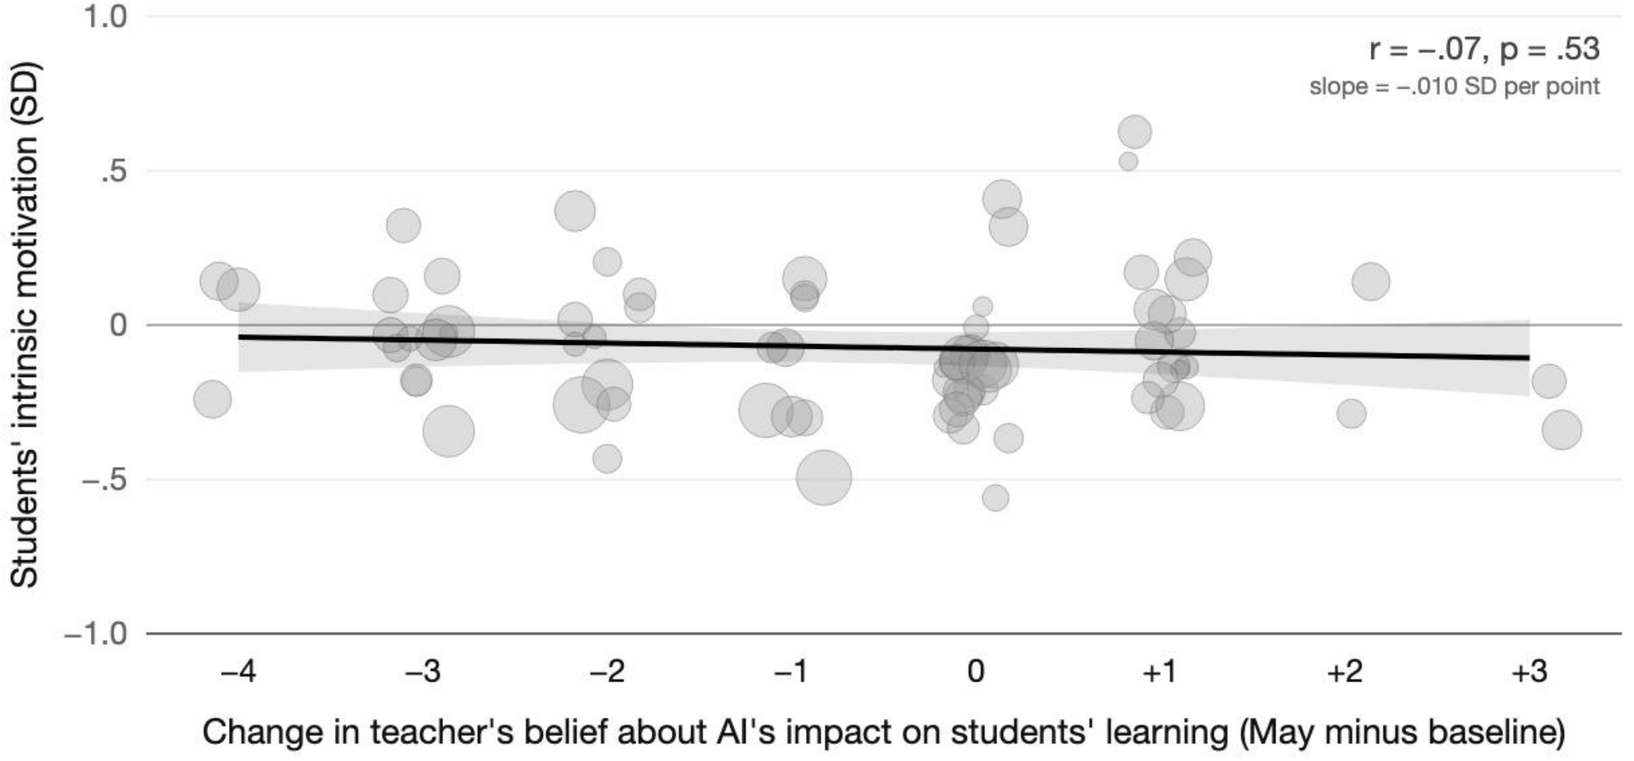

Lee (2009)

No single survey item drives the result

Back

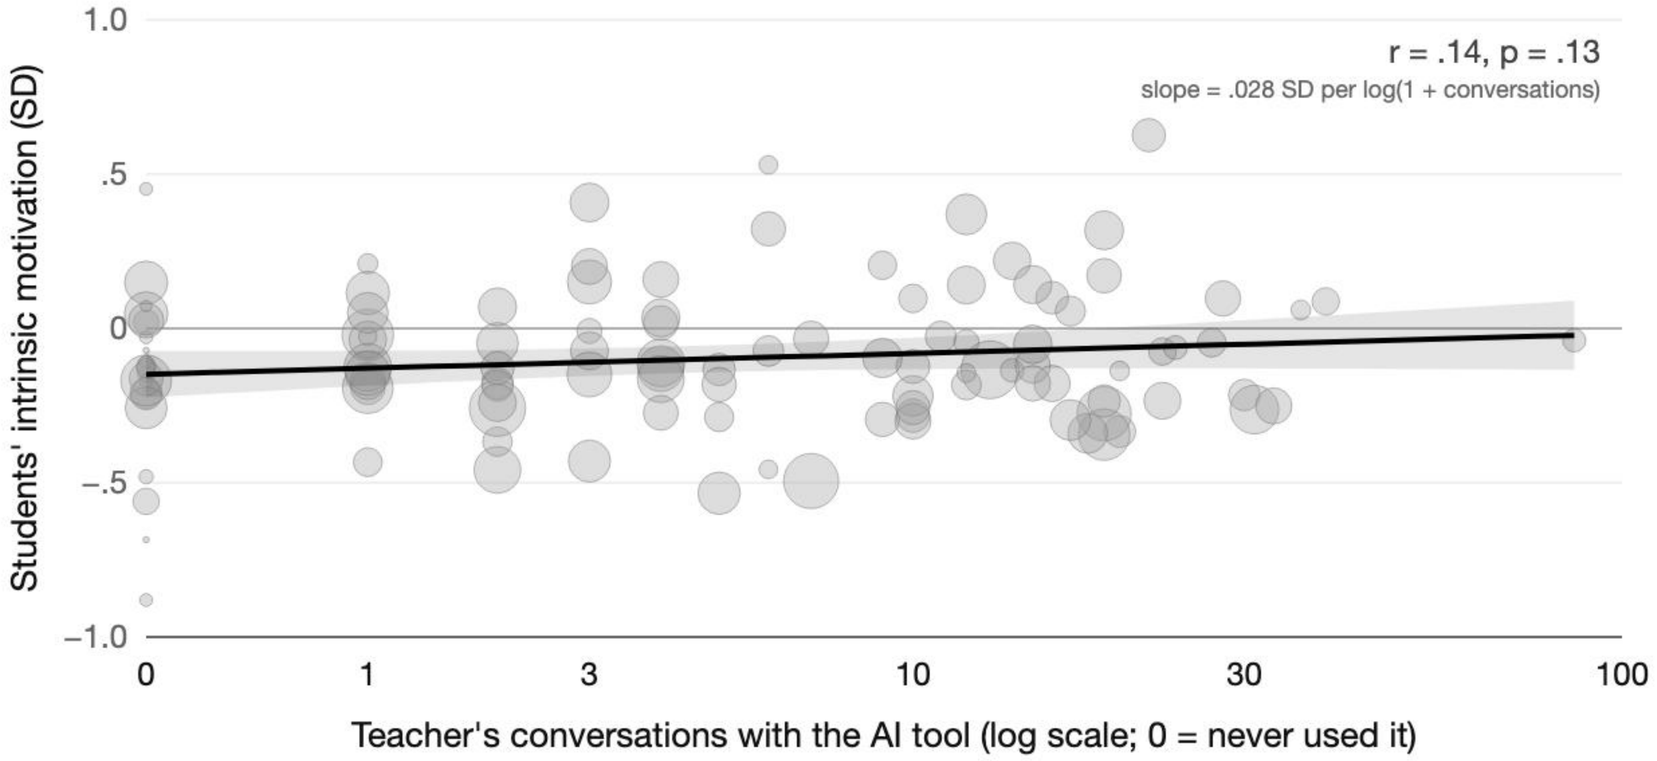

Teachers with less intrinsically motivated students did not grow more skeptical of AI

Descriptive; usage and beliefs were not randomized. N = 77 treated teachers. Dot area = number of surveyed students.

Back

Students' intrinsic motivation did not fall with heavier AI use

Descriptive; usage and beliefs were not randomized. N = 114 treated teachers. Dot area = number of surveyed students.

Estimation

$$Y_{ic} = \alpha + \boldsymbol{\beta} \cdot \mathrm{AI}_d + \gamma \cdot Y_{ic}^{\mathrm{pre}} + \varepsilon_{ic}$$

i student (or teacher), *c* course, *d* school–department (unit of randomization)

β: effect of giving teachers AI (intent-to-treat, both AI arms pooled)

γ: baseline control for test scores and teacher beliefs (students had no pre-survey)

Standard errors clustered by school–department

$$Y_{ic} = \alpha + \beta_1 \cdot \mathrm{AI}_d + \beta_2 \cdot M + \boldsymbol{\beta_3} \cdot (\mathrm{AI}_d \times M) + \gamma \cdot Y_{ic}^{\mathrm{pre}} + \varepsilon_{ic}$$

β_3: does the effect differ by the teacher's prior AI use or baseline performance?
M = 1 if the teacher is above the median

Back

The two AI arms look alike: adoption and usage

Outcome	AI Access	AI Access + Reminder	Arms differ (p)
Adoption Treated teachers only; no control comparison			
Used the tool at least once	80% 24/30	78% 70/90	1.00 means: .78
Conversations per teacher	median 8, mean 9.3	median 4, mean 8.8	.55 means: .83
Prompts per teacher	median 24.5, mean 31.1	median 17, mean 45.1	.96 means: .36
Words written per teacher	median 113.5, mean 241	median 144, mean 435.7	.80 means: .11
Usage Conversations of treated teachers			
Share teaching material	67% 185/278	66% 522/792	.93
Share instructional support	18% 51/278	16% 125/792	.50
Prompts per conversation	median 2, mean 3.4	median 3, mean 5.1	.57 means: **.02**

Treated teachers in the analytic sample: AI Access 30, AI Access + Reminder 90 (non-users count as zero); 278 and 792 conversations.
Used the tool: Fisher's exact test. Per-teacher counts: Mann–Whitney. Prompts per conversation: Mann–Whitney on teacher medians.
Means: OLS, SEs clustered by school–department (per teacher) or by teacher (per conversation). Shares: linear probability model clustered by teacher.

Model Back

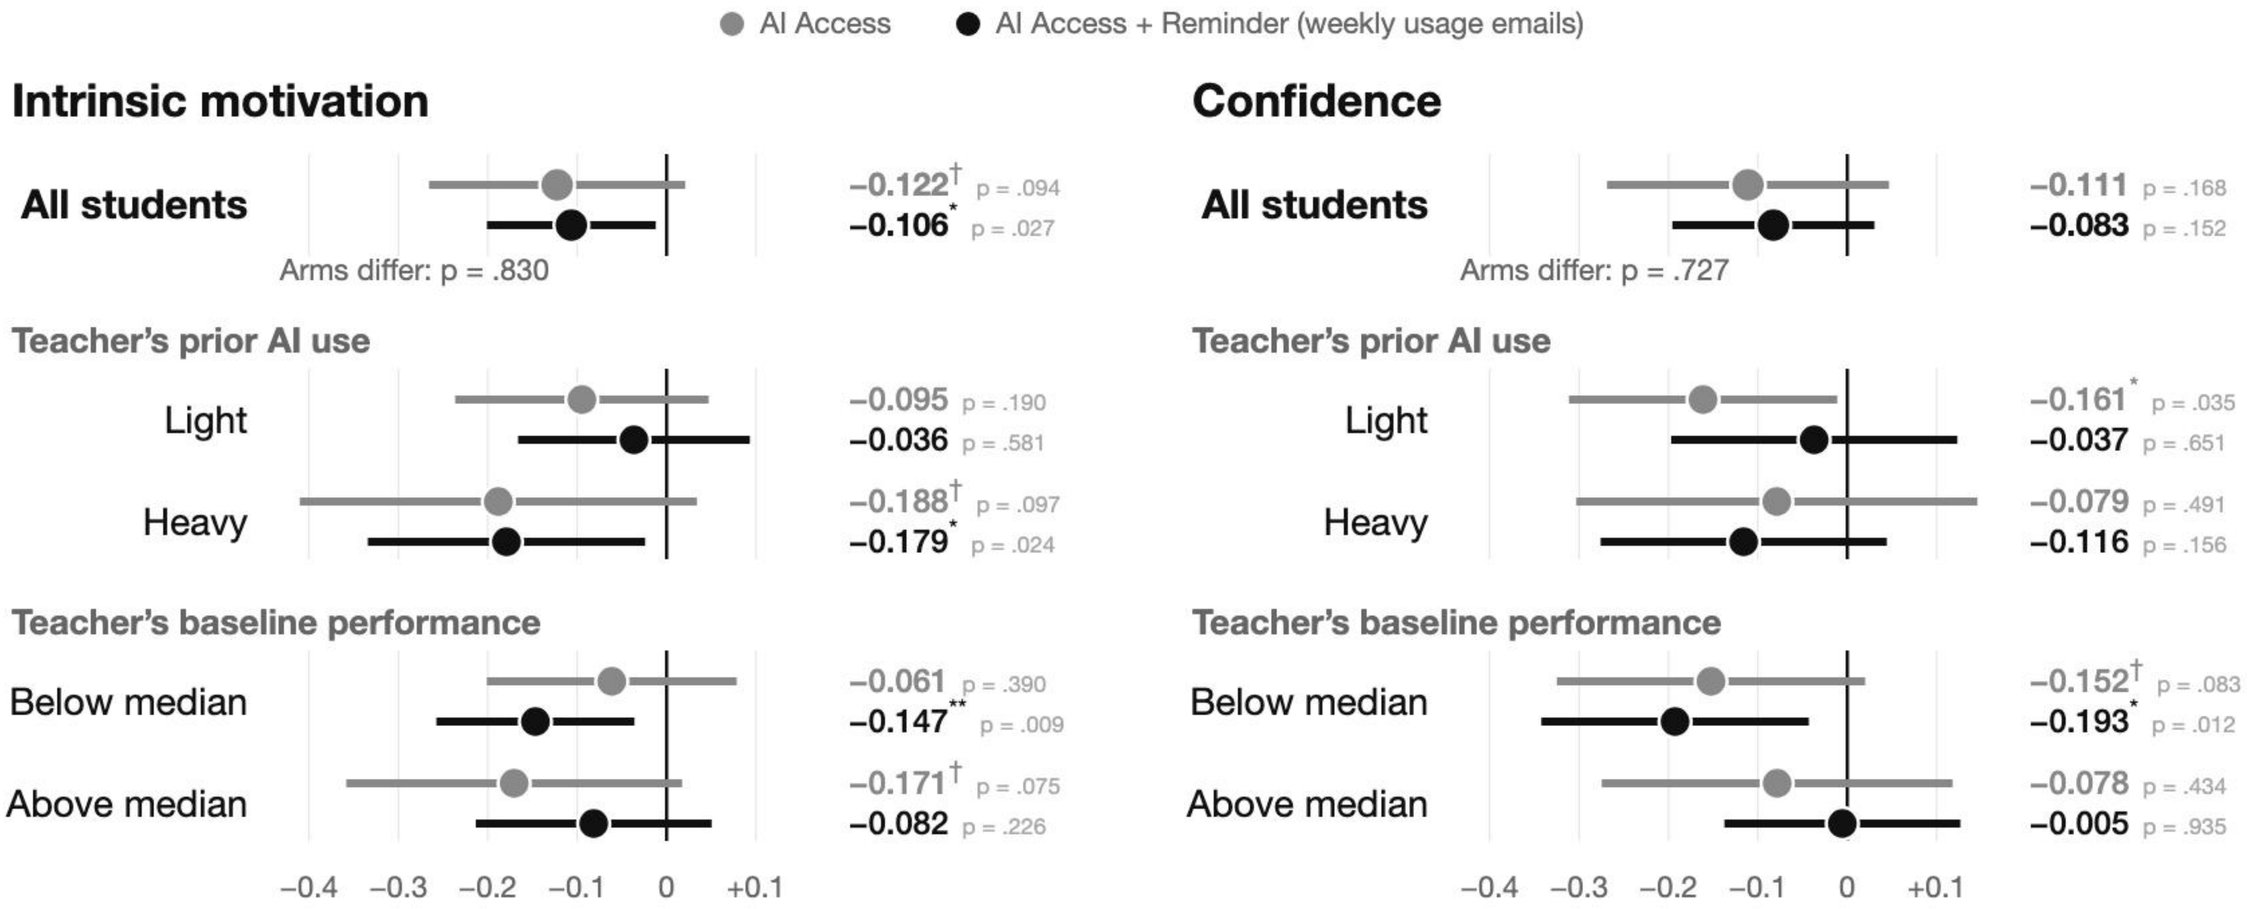

The two AI arms look alike: outcomes

Outcome	AI Access	AI Access + Reminder	Reminder – Access
Intrinsic motivation and confidence			
Intrinsic motivation	–0.12† p = .09 [–0.27, 0.02]	–0.11* p = .03 [–0.20, –0.01]	+0.02 [–0.13, 0.16] p = .83
Confidence	–0.11 p = .17 [–0.27, 0.05]	–0.08 p = .15 [–0.20, 0.03]	+0.03 [–0.13, 0.19] p = .73
Standardized test scores	–0.01 p = .81 [–0.09, 0.07]	–0.02 p = .54 [–0.10, 0.05]	–0.01 [–0.09, 0.06] p = .73
Teacher beliefs	+0.22 p = .38 [–0.27, 0.71]	+0.09 p = .66 [–0.30, 0.48]	–0.13 [–0.58, 0.32] p = .57

N, student–course survey responses: AI Access 1,808, AI Access + Reminder 5,754, control 3,730.
N, student–course test scores: AI Access 2,543, AI Access + Reminder 6,991, control 4,548. N, belief-survey teachers: AI Access 23, AI Access + Reminder 54, control 41.
Effects in SD vs control, 95% CI in brackets: OLS on both arm indicators, baseline control for test scores and beliefs.
Arm difference: Wald test of equal effects. SEs clustered by school–department.
